City Owned Definitions

**Project Type:**

Maintenance: Non-routine and significant maintenance of an existing water access site where replacement or repair is contemplated, but no expansion.

Improvement: Addition of new facilities or uses or expansion of existing facilities or uses to an existing water access site.

Expansion: Expansion of the boundaries of an existing water access site, whether improvements are made or not.

Pedestrian Access: Facilities that allow visual but not physical access to the water: Fishing piers, riverwalks, waterfront parks, overlooks, trails, paths, walkways, etc.

Active: Facilities that allow physical access to the water. Motorized - Boat ramps, docking facilities, mooring buoys, etc. Non-Motorized - Kayak launches, paddleboard launches, rowing center, etc.

Accessibility: Proposed project specifically addresses accessibility needs at a site. All new development projects are required to be ADA compliant.

**Community Context:**

Perception of Need: The survey asked respondents about their overall priorities in terms of funding. The percentage supporting the existing facility enhancement or proposed facility type is listed.

Request for Facility Type: The survey asked what enhanced or additional facilities were supported in each waterway district. More than 20 responses is considered significant, between 10 and 19 is considered moderate, under 10 responses are not included.

Boat Ramp Level of Use: The level of use based on recent observations.

Similar Facilities in District: The team's observations based on similar facilities in the waterway district.

Planning Objective/Source: The citation of a Comprehensive, Vision, Local or other plan that identifies the need for this facility type, or for public water access use of the subject site, or the source of the project in the Maritime Management planning process.

**Cost and Leverage:**

Estimate: General observations from the team on cost. A single kayak launch is an example of "low" relative cost, dredging, significant repairs or new construction of a dock or pier are "medium", repair of a significantly damaged large structure such as the Jacksonville Beach Pier is "high".

Potential Funding Source: Funding programs, including FIND, for which the project may be eligible. If FIND is a potential source, the number of points awarded for the project type is included.

**Risk:**

Useful Life: Structures are assumed to have a useful life of 25 years.

Risk at 2040: Risk of inundation related to projected sea level rise in the year 2040. (For this analysis, the planning team used GIS data for 2040 and 2070 that reflected the "Mean High Water" tidal datum and the "Intermediate" sea level change projection curves. Each existing water access facility was examined individually to assess potential risk from SLR for each of the two decadal scenarios. Based on this assessment, each site was assigned a risk-level described as "No Significant Impact", "Significant Impact", or "Very Significant Impact".) Where access or the site itself is projected to have very significant impact, it is noted on the matrix.

Risk at 2070: Risk of inundation related to projected sea level rise in the year 2070. See above.
